

## Green Home for Beginners: Seven pillars to an eco-friendly home using renewable energy, Green building practices and clean sustainable living (Green House Guide Series)

Why you need to read this book ? This book contains proven steps and strategies that can help one build a completely sustainable home from the ground up. While many books and other forms of media feature several tips and tricks supposed to help you step into the greener side of the pasture and live life more harmoniously with the environment, very few would be able to help you tackle the concern in a completely holistic manner. This book helps you live green by giving you information about different important facets in sustainable living: The First Pillar: Energy Gathering and Conservation The Second Pillar: Water Conservation The Third Pillar: Green Building Materials The Fourth Pillar: Sustainable Architecture and Eco-Friendly Contractor The Fifth Pillar: Green Chemicals and Household Products The Sixth Pillar: Organic Gardening Seventh Pillar: Waste Management After reading this book, you will get an idea and a motivation to start living green, - no matter where you are, or what you have. It is simply a matter of tapping into the rhythms of nature itself, and this book will be your guide. Why Should I Go Green? Many people are wondering are there any real, personal benefits one can get for living green? There are those who view it as only a sacrifice with no real gains. This chapter will tackle exactly these benefits that are very close to home. Specifically, it will help us understand the gains green living can afford in our: Finances Health Community The Earth has always been the main driving force of itself. Nature bent Life as she saw fit, making the most out of everything to ensure the preservation of a delicate balance. That was the picture until we humans came along. Then, the Earth was bent to our will, its resources harnessed to fulfill our needs. Nature itself has been used for pleasure, and before we knew it, the world was no longer the green

planet that we knew. It has turned into a dying shade of gray. It is on the brink of collapse, and it will ultimately return us all to where we once were nothingness. And so began the global clamor to save the Earth from continued destruction. However, many people still believe that the mission to preserve nature is something best left to experts. As far as most people are concerned, they can still go through with their daily tasks without worry. They think of things like renewable energy and self-sustenance as something that is far away from their realms. This belief is dead wrong there are several ways even the normal household can take part in the green crusade, and most of these are a lot simpler than we may think. In fact, only when even lay people join the march can we be truly successful in reversing Nature's decline. Personally, helping save Mother Earth can also be very rewarding, as there is a myriad of benefits one can gain simply by going green. The most relevant of these will be explored in this chapter. Financial Benefits Of course, the pocket is one of those things dearest to the heart of every man. It has been said that the very reason we have allowed the environment to deteriorate was because we had exchanged the forests and the seas for the profit made by industries in their stead. However, this trend is fast reversing, as the world starts to reward going green with greenbacks. Transportation. One of the most costly events in a person's daily life is to move from one place to another, what with the continuous rise in global oil prices. Going green on your mode of transport, such as owning a more fuel efficient car, can significantly cut back on these expenses. (more inside...) Get Your Copy Today
